

Alvy: AI-Based Task Manager and System Load Optimizer

Welcome to **Alvy** — your intelligent, comment-free, no-frills AI task management assistant. Built using Python and Flask, Alvy empowers users to monitor real-time system load and receive smart, context-aware task suggestions based on CPU, memory, and GPU usage.

The Alvy Edge

Unlike conventional task planners that depend on static inputs, Alvy adapts to your machine's **live workload**, enabling smarter decisions about when and what to execute. It's perfect for:

- Personal productivity and task planning
- Load-sensitive application development
- Intelligent system resource optimization
- Educational demos on AI-assisted workload management

Key Features

Live System Monitoring

Get real-time insights into your system's CPU, memory, and GPU usage.

AI-Based Task Validation

Check if a task is suitable for your system's current state before starting it.

Smart Suggestions

Automatically receive high or low workload tasks based on rolling historical usage.

Historical Tracking

Track past CPU, memory, and GPU stats with rolling averages for better prediction.

Clean Web UI

Modern interface built with HTML, CSS, and Bootstrap — no clutter, just clarity.

One-Click CSV Export

Export historical performance data with a single click (optional feature).

Tech Stack

- Python
- Flask
- psutil
- pandas
- GPUUtil for GPU metrics

Conclusion

Alvy isn't just another system monitor — it's your AI-powered co-planner. Whether you're optimizing tasks on a high-performance machine or simply trying to avoid lag during work, Alvy offers clarity, control, and insight through an intuitive interface.
